1.1 Monday, 13th April

1. Slope Fields are drawings with the slope at any given point, and can tell a lot about a differential equation without solving it.
2. A big reason slope fields are useful is that there are some differential equations we are unable to solve. The handout has some examples and rules.
3. Drawing out a slope field by hand is tedious and unpleasant, so don't do it unless you have to.

1.2 Tuesday, 14th April

1. Continuing from April Fools' Day:

$$\frac{dy}{dx} = 4xy \quad (1)$$

$$\int \frac{1}{y} dy = \int 4x dx \quad (2)$$

$$\ln y = 2x^2 + C_1 \quad (3)$$

$$y = Ce^{2x^2} \quad (4)$$

2. $\frac{dy}{dt}$ is the same as a rate of change, but it's also a part of a differential equation.

$$\frac{dy}{dt} = ky \quad (1)$$

$$\int \frac{1}{y} dy = k dt \quad (2)$$

$$\ln y = kt + c \quad (3)$$

$$y = Ce^{kt} \quad (4)$$

3. **Growth and Decay** gives us the equation $y = Ce^{kt}$ where C is the initial value, k is the constant of proportionality, e is e , and t is time. If k is positive, it is growing, and if negative, it is decaying.

4. In many problems using growth and decay, we want to first find k .

$$4 = Ce^{2k} \quad (1)$$

$$4 = 2e^{2k} \quad (2)$$

$$2 = e^{2k} \quad (3)$$

$$\ln 2 = \ln e^{2k} \quad (4)$$

$$\frac{1}{2} \ln 2 = k \quad (5)$$

5. Continuing on, using this fact:
